

Are shared e-scooters good for climate change?

Analyzing the case of Paris.

Modal carbon footprint in Paris

How much do
I emit
when
I travel?

3

Carbon footprint of the e-scooter disruption

+12 000 tCO₂eq over one year
(1M user assumption)

Can we reverse this trend?

Lifetime mileage and servicing influences

1. What if e-scooters last longer?

2. What if we change the servicing pattern?

A few take-home messages

A black electric scooter is parked in the foreground, its handlebars and deck visible. In the background, the Eiffel Tower rises against a clear blue sky. Bare tree branches frame the scene on the left and right sides.

In Paris, first generation shared e-scooters were **very likely** harmful to climate change

Optimizing **both** e-scooter **lifespan** and **servicing** is required to reverse this trend

BUT: these results are not
« transferable » to other
cities: a tailor-made
assessment is required

E-scooters and **microvehicles** must have a role to play in a sustainable mobility system

Supply chain matters :
assess the environmental
performance of mobility
using LCA

Vehicle manufacturing of
new mobility technologies
can have a **major**
environmental influence
