Time to sweat the  
assets?:  
The analysis of two  
airport cases of  
restricted capacity in  
different continents

*Miguel Mujica Mota, Geert Boosten, Catya Zuniga*

# Defining and measuring airport capacity

Capacity has been analysed and defined by different authors...

- Reichmuth, Berster, & Gelhause (2011)

*“Capacity is related to capability of a facility to handle people, freight and vehicles...”*

- Barhart et al. (2012)

*“Capacity is defined by the number of movements per hour ...”*

- Upham, Thomas, Gillingwater, & Raper (2003)

*“Capacity is a function of operational and environmental constraints...”*

# Airport operations approaches tends to focus on:

- The relationship between flight schedules, airport capacity and delays
- The relationship between airports and airlines and their respective business models
- As the interaction between four main factors:
  1. Operational, sizing and design of airside and landside infrastructure
  2. Economics
  3. Environmental restrictions and regulations and
  4. Social perception towards airport infrastructures

However...

*no single/ unique definition of airport capacity can be found;  
interaction between drivers can vary per airport*

# Our definition

It is proposed to define airport capacity as a multifactor function leaves

$$\textit{Airport capacity} = f(\textit{Factor 1}, \textit{Factor 2}, \textit{Factor 3}, \dots, \textit{Factor n})$$

Technical Constraints

Environmental Constraints

Physical Boundaries

Airline Business Models

Airport Business Models

Relationship Airport-Airline

Relationship Region-Airport

Governmental Regulations

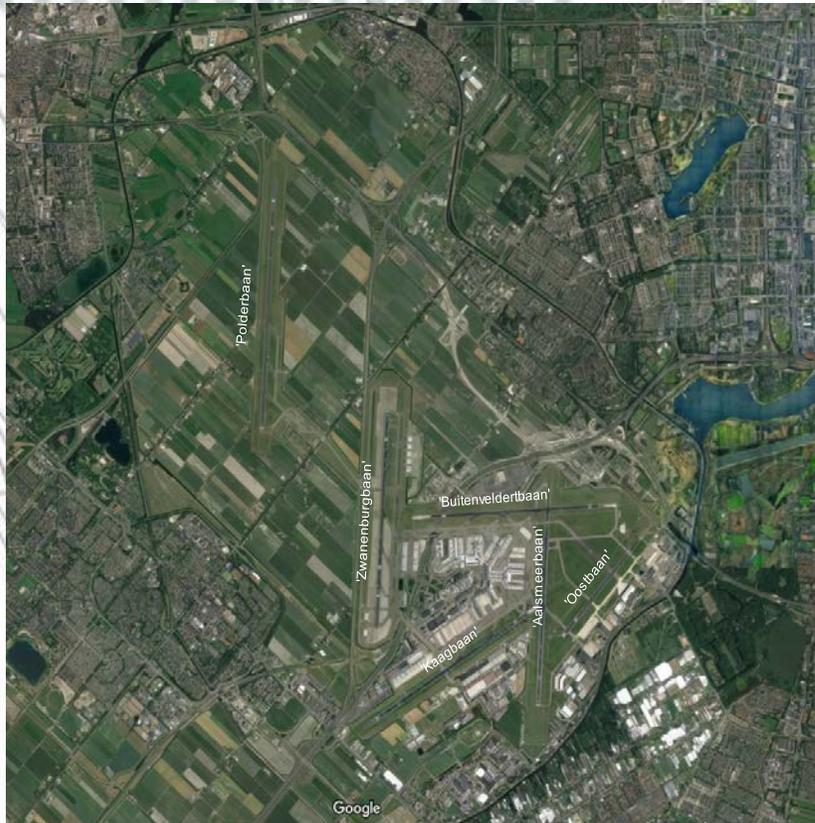

Societal Behaviour

# Factors that define capacity of an airport

Limiting Factor	
Technical Constraints	<ul style="list-style-type: none"><li>• Runways</li><li>• Terminal buildings</li><li>• Taxiways</li><li>• Technology on board/airport</li></ul>
Environmental Constraints	<ul style="list-style-type: none"><li>• Noise emissions</li><li>• Pollution</li><li>• Weather</li></ul>
Physical Boundaries	<ul style="list-style-type: none"><li>• Available land on and off-airport</li></ul>
Airline Business Models	<ul style="list-style-type: none"><li>• Hub and spoke/ point-to-point</li><li>• Connectivity</li><li>• Frequency</li></ul>
Airport Business Models	<ul style="list-style-type: none"><li>• Aeronautical business</li><li>• Non-aeronautical businesses</li></ul>
Relationship Airport-Airline	<ul style="list-style-type: none"><li>• Low-cost carriers / Full Service Carriers</li><li>• Minimum connection times</li><li>• Position of dominant airline</li></ul>
Relationship Region-Airport	<ul style="list-style-type: none"><li>• National economy, demand for connectivity, triple helix</li><li>• Business/development models of government</li></ul>
Governmental Regulations	<ul style="list-style-type: none"><li>• Security regulation</li><li>• Night curfew</li><li>• Land-use planning</li></ul>
Societal Behaviour	<ul style="list-style-type: none"><li>• Human behaviour inside and outside the airport</li><li>• New technology influencing passenger choice</li></ul>

# Case studies

## Amsterdam Airport Schiphol

## Mexico City Airport (AICM)

Limiting Factor	Schiphol	AICM
<b>Technical Constraints</b>	<ul style="list-style-type: none"> <li>• Five runways, not most constraining factor</li> <li>• Taxiway system</li> <li>• Peak hour capacity</li> </ul>	<ul style="list-style-type: none"> <li>• Peak hour movements runway most constraining</li> <li>• Two runways operate in a segregated mode</li> <li>• The soil conditions of the airport</li> </ul>
<b>Environmental Constraints</b>	<ul style="list-style-type: none"> <li>• 500,000 ATM per annum</li> <li>• Noise contour</li> <li>• Emissions</li> </ul>	<ul style="list-style-type: none"> <li>• Fog in winter</li> <li>• Cumulus clouds on summer (on Santa Lucia approximations)</li> <li>• Wind (related to runway)</li> </ul>
<b>Physical Boundaries</b>	<ul style="list-style-type: none"> <li>• Airport land</li> <li>• Noise contours</li> <li>• Land-use planning</li> <li>• Local communities</li> </ul>	<ul style="list-style-type: none"> <li>• Airport surrounded by urban (3-4floor buildings, antennas)</li> <li>• For landing and departs ops, mountains and building (mainly on the south)</li> <li>• Airport landside layout:</li> <li>• TWB (blocking taxi ops) and T2 (“U” shaped)</li> </ul>
<b>Airline Business Models</b>	<ul style="list-style-type: none"> <li>• Main user KLM/Skyteam 70% of business</li> <li>• Hub operations with competition on frequency</li> <li>• Important LCC and charter market</li> </ul>	<ul style="list-style-type: none"> <li>• Main user AeroMexico/Skyteam</li> <li>• Mainly O/D traffic</li> <li>• High LCC participation</li> </ul>
<b>Airport Business Models</b>	<ul style="list-style-type: none"> <li>• Airport City concept</li> </ul>	<ul style="list-style-type: none"> <li>• Aero- and non-aerobusiness in terminals</li> <li>• Mix Tourist/Business model</li> </ul>
<b>Relationship Airport-Airline</b>	<ul style="list-style-type: none"> <li>• Strong demand for connectivity, triple helix</li> <li>• Airport important economic factor</li> </ul>	<ul style="list-style-type: none"> <li>• Dominant carrier and alliances</li> <li>• Long term commitments (AMX-T2)</li> <li>• Slots to operate at AICM</li> </ul>
<b>Relationship Region-Airport</b>	<ul style="list-style-type: none"> <li>• Strong demand for connectivity, triple helix</li> <li>• Airport important economic factor</li> <li>• Airport involved in regional development</li> </ul>	<ul style="list-style-type: none"> <li>• Mexico hub</li> <li>• Political parties (only for 6 years duration at the most)</li> </ul>
<b>Governmental Regulations</b>	<ul style="list-style-type: none"> <li>• Slot regulations</li> <li>• Night limitations</li> <li>• Airport system development</li> <li>• Security</li> </ul>	<ul style="list-style-type: none"> <li>• Slot regulations</li> <li>• Night limitations</li> <li>• No formal relationship with domestic airports</li> <li>• Security</li> </ul>
<b>Societal Behaviour</b>	<ul style="list-style-type: none"> <li>• Experienced travellers</li> <li>• Human size facilities</li> <li>• Limited acceptance for hinder</li> <li>• New technology implemented in to support passenger choise</li> </ul>	<ul style="list-style-type: none"> <li>• Tourist/Business travellers</li> <li>• Proposal of New AICM land used of communal lands</li> </ul>

# Main drivers to increase operational capacity

For Amsterdam Airport Schiphol:

- **Negotiations with stakeholders on ATM-capacity**
- **Creating leverage by supporting quality of life and nature in the airport area**
- **Slot allocation**
- **Moving flights to other airports in system**
- **Increase peak hour capacity**
- **Economic instruments/regulation**
- **Mainport policy: contribution airport to national economy**
- **Smart use of existing infrastructure/facilities**

For Mexico City Airport (AICM):

- **Revisiting the slot allocation policies**
- **Traffic deviation (TLC)**
- **Analyse in deep current operations**
- **Simulation to understand airport operations**
- **Flexible use of existing facilities**
- **Coordination within airport network (with domestic airports)**
- **Airport layout/ New airport project**
- **Transparent procedures from all stakeholders**

# Current challenges

## Schiphol

- Schiphol reaching 500,000 ATM earlier than expected
- How to assign slots within ceiling
- How to divide traffic over Schiphol and reliever airports
- Invest in off-airport activities or in improving quality of life within communities
- Very complex Air Space in between the airport system: how to improve ATC with traffic growth at all airports
- Need to solve problems within a network context
- Investment decisions in expanding airport facilities and airspace

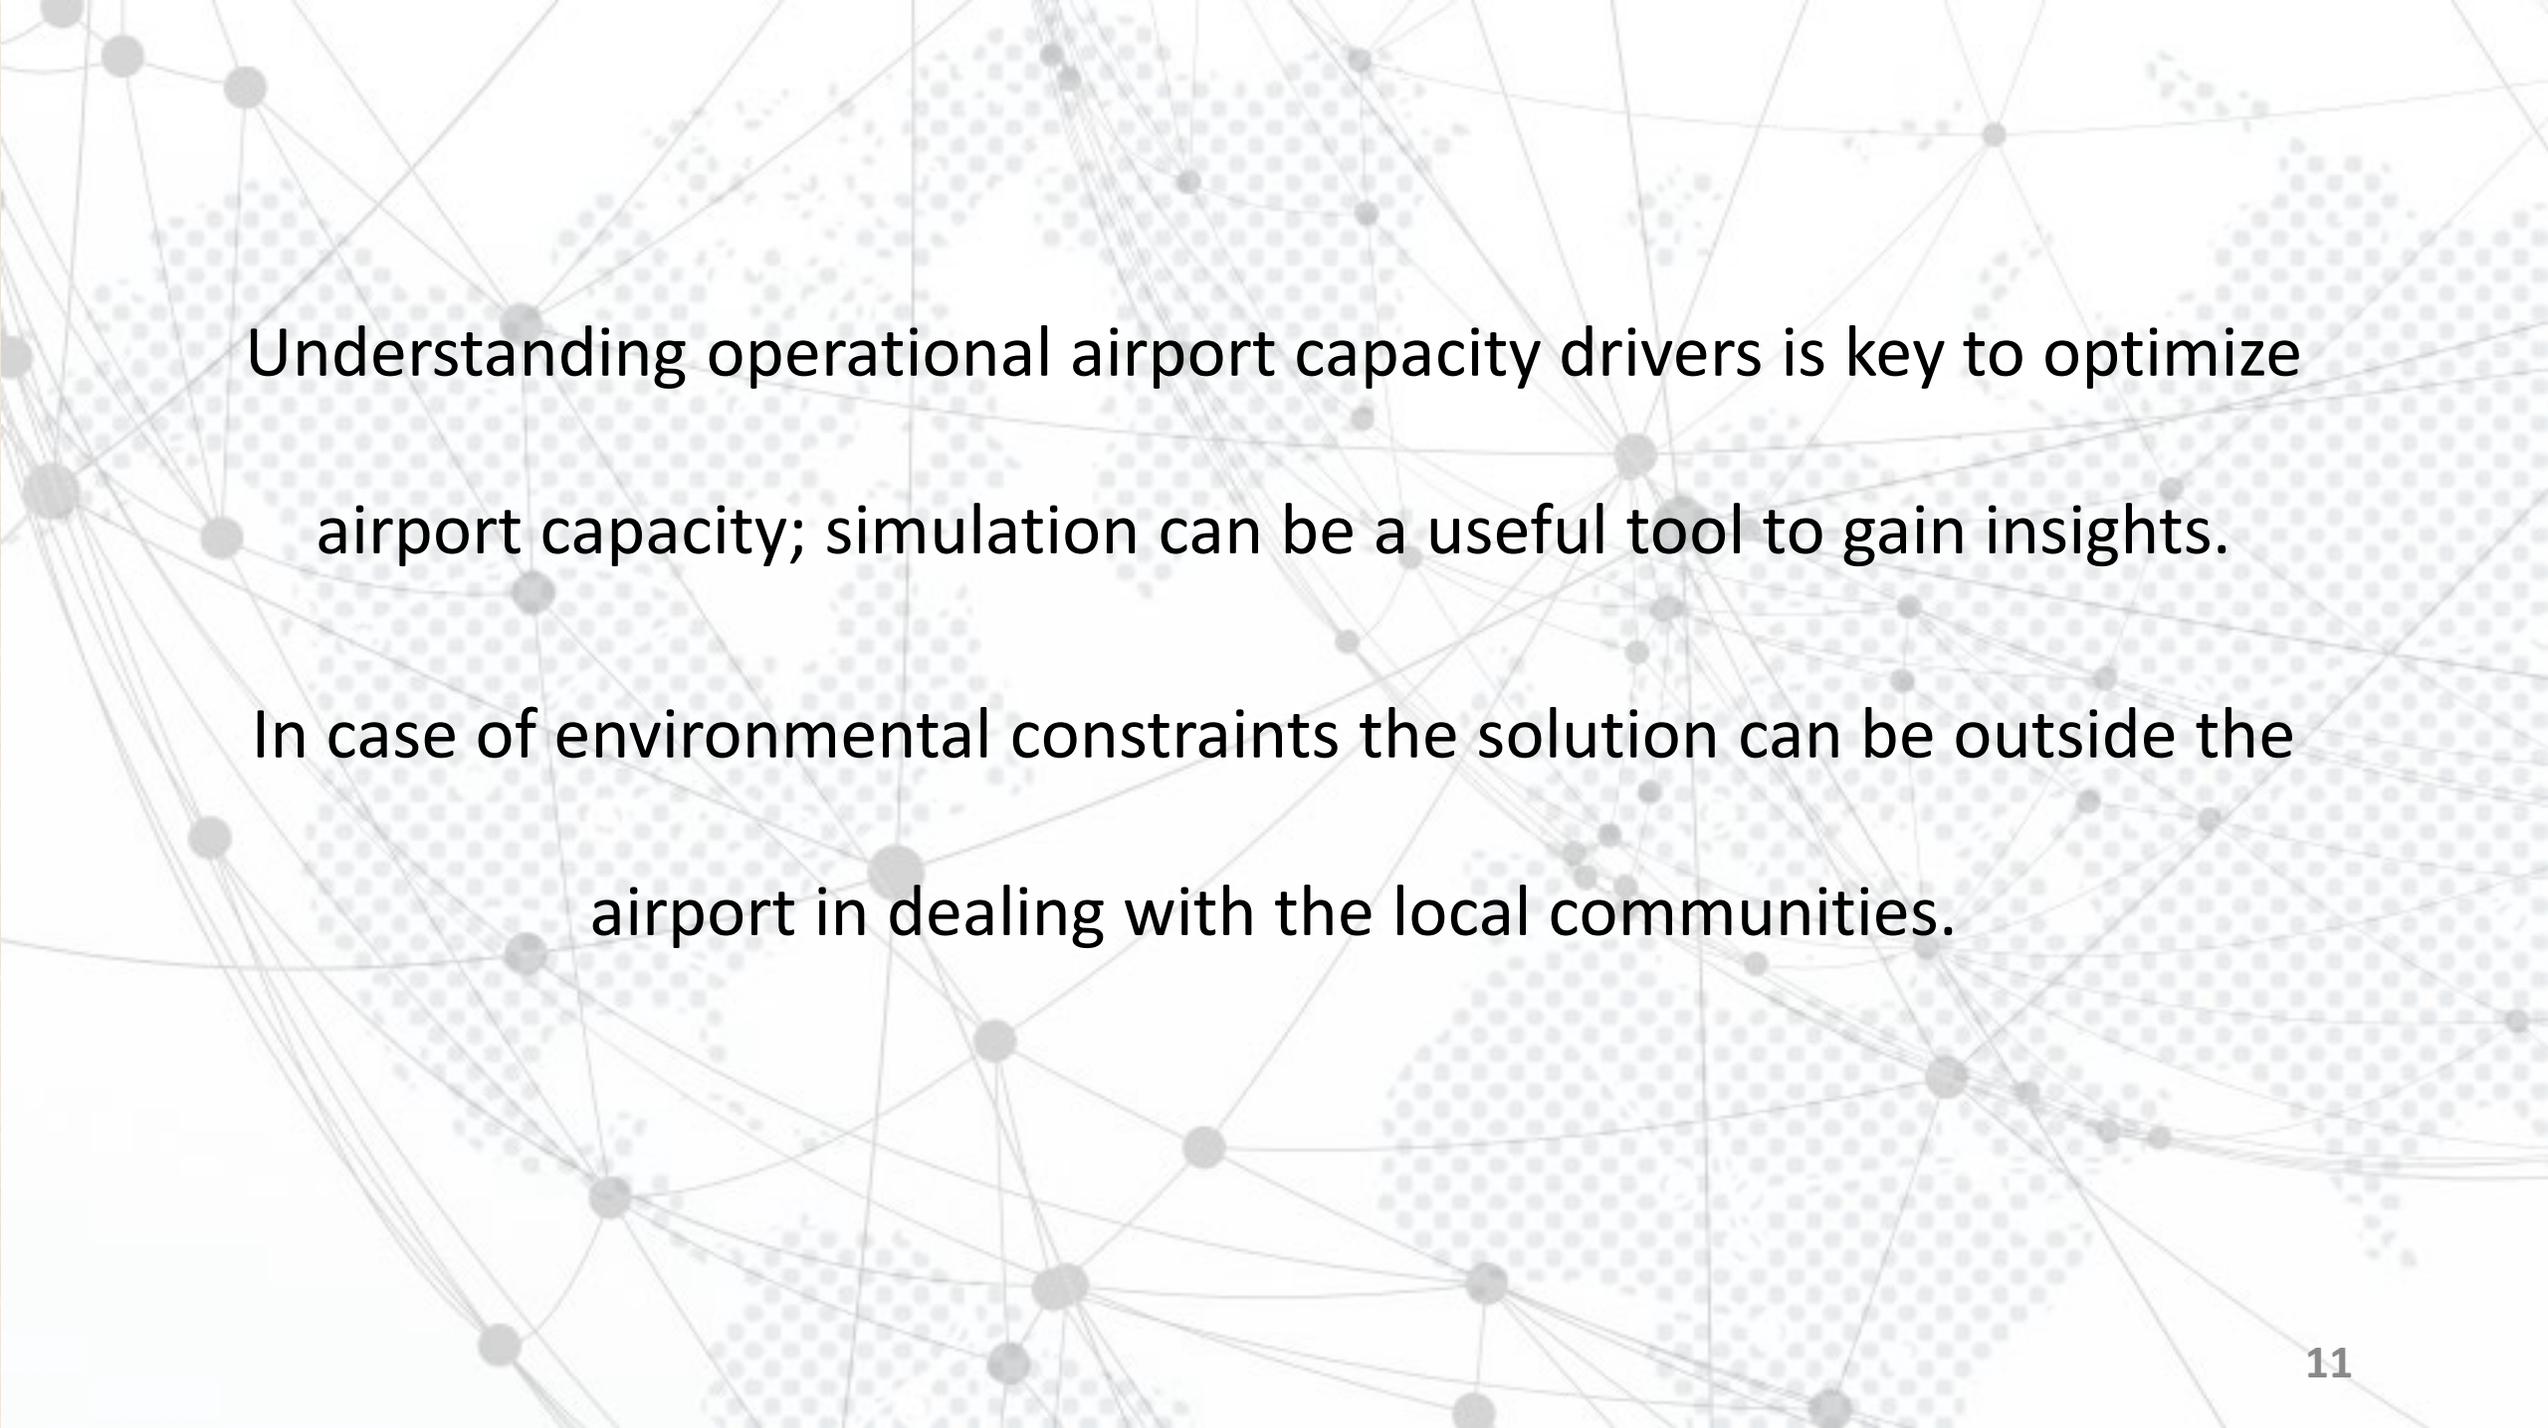

## AICM

- Maximum arrivals per hour limit development airport and block new airline entries
- Network solutions (ground delay) cause delay at domestic airports
- Unbalance in use terminal facilities compared to domestic and international peak
- Exploit the benefits for all stakeholders of other slots policies
- Deviate some of the traffic to relievers airports
- Optimize the information processes (knowing what is happening, CDM)
- Need for simulation to gain insights in optimization options for operations

# Conclusions

Both airports look for solutions to meet the growing demand.

Schiphol Airport growth potential is limited by *environmental limitations in terms of noise and emissions* while the International Airport of Mexico City is limited by *the technical capacity of the runway and air traffic control.*

Understanding operational airport capacity drivers is key to optimize airport capacity; simulation can be a useful tool to gain insights.

In case of environmental constraints the solution can be outside the airport in dealing with the local communities.

Thank you!!!!
