

# **International Transport Forum Expert Workshop International best practices to promote eco-friendly cars**

25 January, 2021

# Taking stock of clean car policies and technologies

Jacob Teter

Transport Energy Analyst, International Energy Agency

# What progress has been made thus far?

Average new LDV fuel economy by country or region (2005-17) and new registrations (2017)

Note: Fuel consumption measured in Lge/100 km, WLTP.

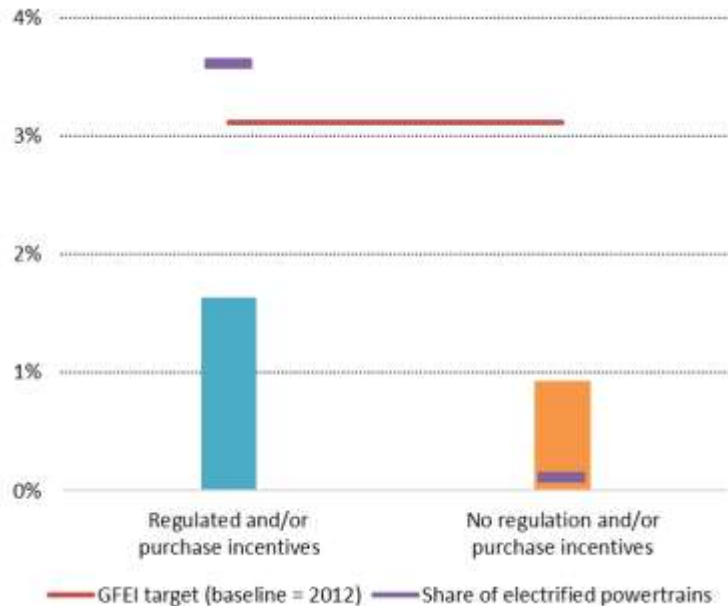

Sources: IEA elaboration and enhancement for broader coverage of IHS Markit database (IHS Markit, 2018).

Source: IEA, 2019 - [Fuel Economy in Major Car Markets: Technology and Policy Drivers 2005-2017](#)

**Average LDV fuel economy improved in all regions between 2005 and 2017, though there is a wide divergence of absolute levels and trends between countries and regions.**

# What policies have been successful in promoting clean cars?

Average annual fuel economy improvement rates, selected countries, 2012 and 2017

Rated fuel consumption (l/ge/100 km) and gasoline price (2016) for selected countries, 2017

Notes: GDP values refer to USD with annual average exchange rates in 2017. Gasoline prices are for 2016. Advanced < USD 1/L = advanced economies with gasoline prices below USD 1 per litre; Advanced > USD 1/L = advanced economies with gasoline prices above USD 1 per litre.

Source: IEA, 2019 - [Fuel Economy in Major Car Markets: Technology and Policy Drivers 2005-2017](#)

**Fuel economy policies and road fuel taxation have driven reductions in fuel consumption**

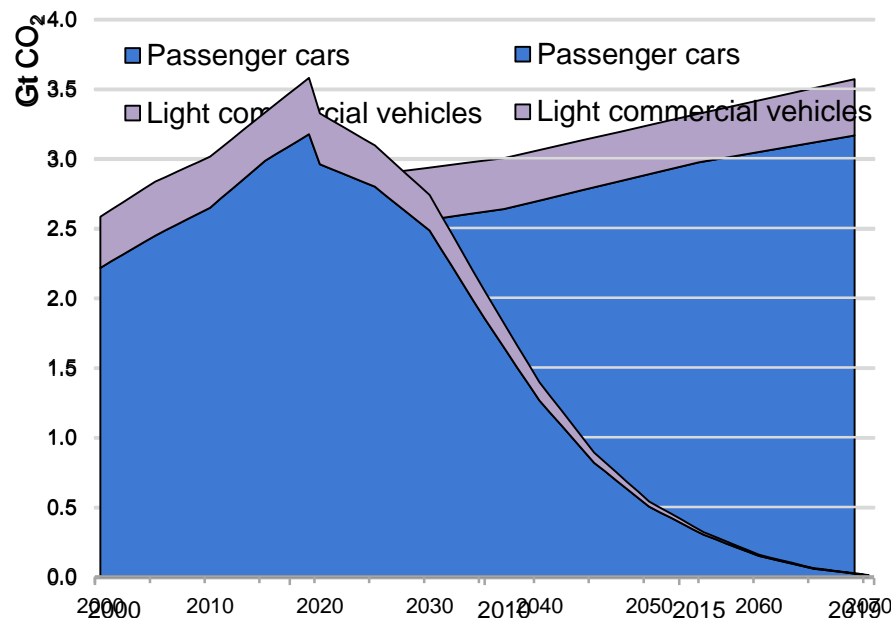

# Progress to date has been measurable, but limited

Gap between tested and real-world CO<sub>2</sub> emissions – Europe

Source: ICCT 2019 - [Real-world vehicle fuel consumption gap in Europe is stabilizing](#)

Direct global CO<sub>2</sub> emissions from light-duty vehicles

Source: IEA 2020 – [Energy Technology Perspectives](#)

**The gap between rated fuel consumption and real-world performance, together with growth in global ICE car stocks, translates to continuing growth in direct CO<sub>2</sub> emissions. But emissions from cars need to decrease dramatically.**

# But are electric cars really better for the environment?

“Where there’s smoke, there’s fire”

Is it really the end of internal combustion engines and petroleum in transport?

## Highlights

- Demand for transport is large, growing, powered by combustion of petroleum fuels.
- All alternatives start from a low base and cannot grow rapidly or without restraint.
- Forced rapid change will incur large environmental, economic and social costs.
- Transport will be powered mostly by combustion engines/petroleum for decades to come.
- Limited electrification as hybridization will help combustion engines to improve.

Always Check/AT/DT/Getty Images

If you believe the headlines, traditional automobiles are speeding toward a dead end. All those V8s, V6s and turbocharged vehicles we've grown to love will soon be replaced by squadrons of clean, whisper-quiet, all-electric vehicles. And if you believe the headlines, the environment will be much better off.

**Electric cars only greener than petrol after 50,000 miles**

**In all contexts but the most coal-intensive grids, reputable lifecycle analysis studies find that EVs already outperform ICEs in terms of GHG emissions. These results are robust to a wide array of assumptions.**

# The climate advantage of alternative powertrains is clear

Lifecycle GHG emissions for passenger cars by powertrain, 2018

Source: IEA, 2020 – [Global EV Outlook, 2020](#)

**Under the global average GHG intensity of electricity generation, BEVs provide life-cycle GHG emissions benefits relative to ICE vehicles. As electricity generation decarbonises, GHG emissions of BEVs and PHEVs will significantly decline.**

# Bridging the purchase price gap

- EV subsidies and other purchase incentives have been instrumental in driving EV adoption in all main EV markets

National subsidies for BEV purchase (USD)  
(maximum amount\*, USD equivalent, private cars, as of March 2020)

Source: IEA, 2020 – [Global EV Outlook, 2020](#)

\*Amount can depend on car sticker price, battery capacity or range

- Additional stimulus policies in Q1-Q3 of 2020 targeted EVs: including incentives in Germany, France, Italy, extension of subsidies in China and the UK.

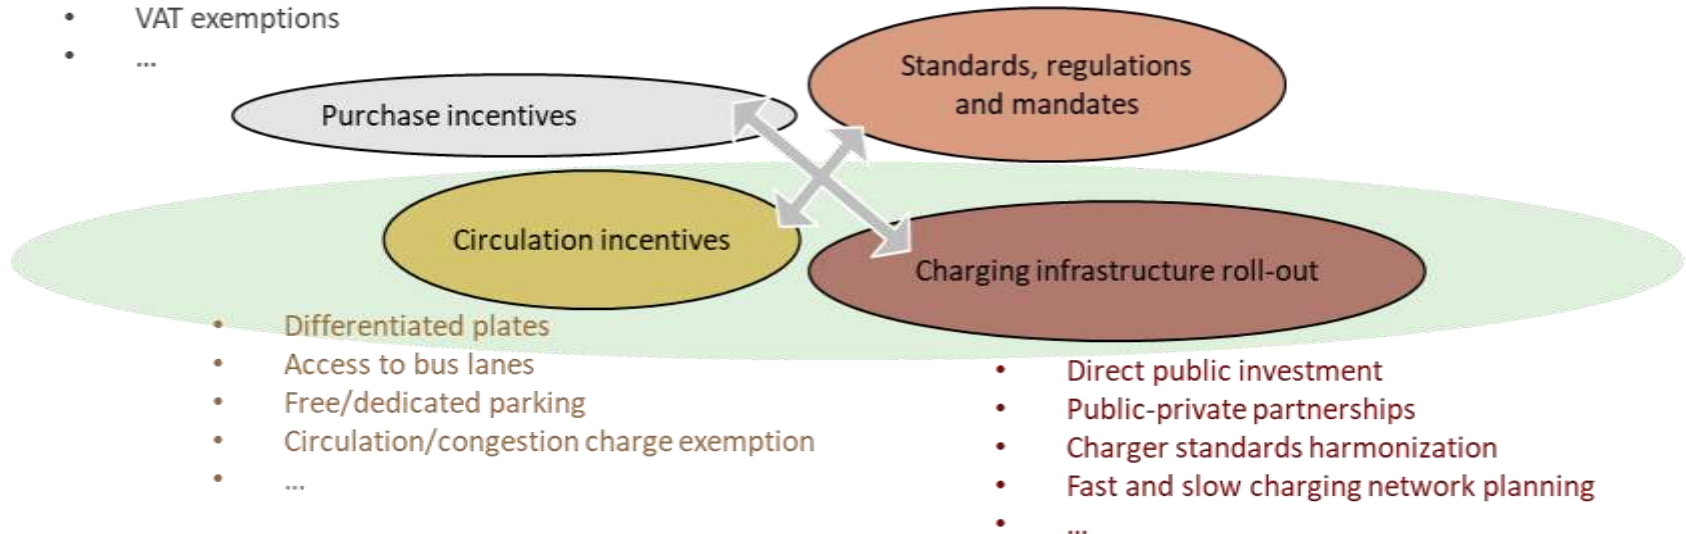

**EV purchase is incentivised at a national level in most key markets, in the form of subsidies and/or tax reduction**

# Zero-emission vehicle support policies

- CO<sub>2</sub>-based, technology-based differentiated taxation and rebates
- Feebates
- VAT exemptions
- ...

- Fuel economy standards
- Fuel taxes
- Public fleets, taxi fleets initiatives
- ZEV mandates

**Close monitoring of the effect of EV support policies are paramount to avoid adverse effects**

# EV policies continue to evolve and adapt

Countries with ICE car phase out goals, or 100% EV sales targets

**17 countries have announced a phase out of conventional cars or 100% EV sales within the next three decades**

## Challenges

- 1. Shift from near-total dependence on oil to ZEVs leads to revenue losses**
  - from vehicle taxation exemptions (e.g. Norway) and from EV subsidies
  - from fuel taxation (e.g. California)
- 2. Resources – shift from strategic geopolitical importance of fossil fuels to critical minerals**
  - Critical minerals in batteries: fluctuating prices, stockpiling, concentrated extraction
  - Not limited to batteries: efficient use of the vehicle stock to provide mobility services, and efficient use of space in increasingly congested cities

[Further challenges, both of which could provide big opportunities:](#)

- 3. Potential shift to connected & automated cars, and transition from ownership to service-based mobility**
- 4. Charging availability / impacts on electricity grids**

## Solutions

- 1. Extract revenue based on externalities of vehicle operations**
  - Road pricing, mileage-based user fees, congestion charges
  - Travel demand and parking management
  - Urban planning
- 2/3/4. Circular economy – from a vision to a reality in the car industry**
  - Increased supply chain transparency (e.g. long-term mining contracts)
  - Battery end-of-life / circularity / extended producer responsibility (battery passport concept, China's battery regulation)
  - Clarity and certainty over future market (ZEV mandates, targets, bans)
  - Multimodality / more efficient use of vehicles (e.g. Mobility-as-a-Service)
